Operational binding review

root-library-validation-v4-20261109

Source-only; no compiler, payload or measurement executed.

1. All25 recipe file hashes match the immutable admission; worker b3de879c, launcher32d75270 and helper2034c58e match the independent source review.

2. Qualification result24/24 passed matches these exact worker/launcher pins; terminal exit0/reaped and qualification review are bound. Prior parser qualification and cache-walk review remain retained.

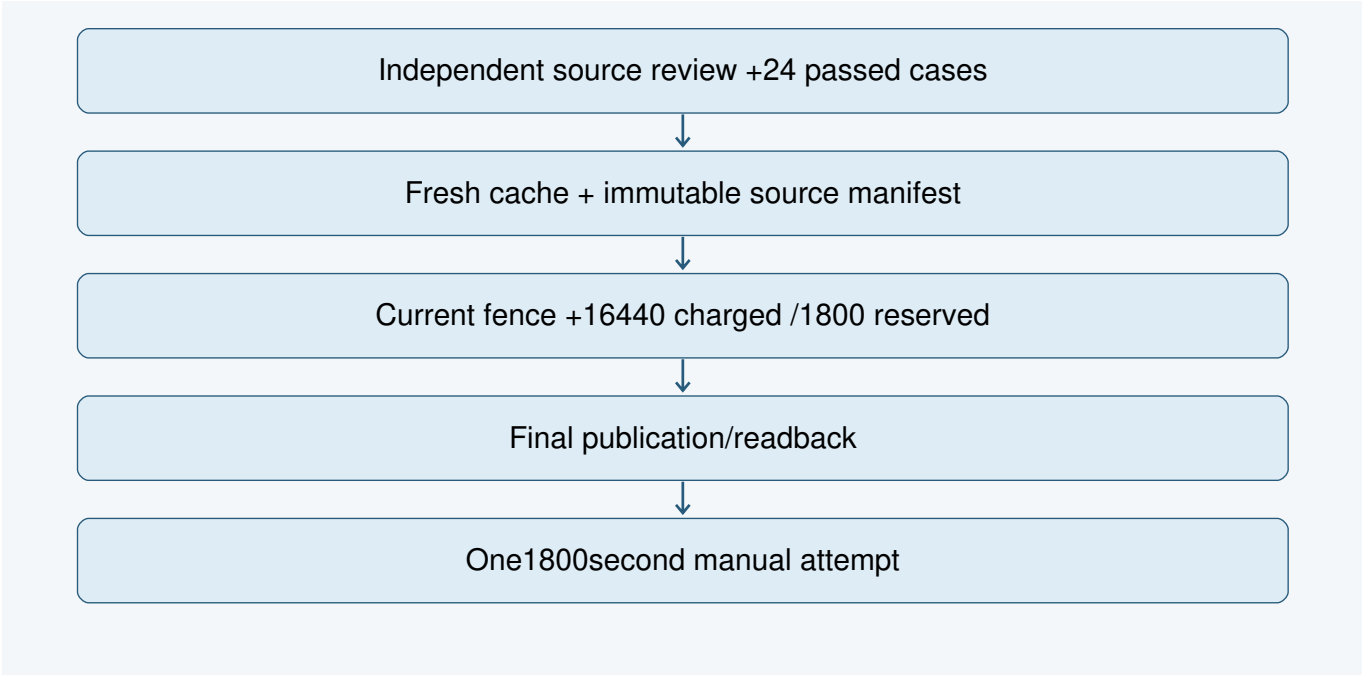
3. Fresh cache manifest c6e7c617 contains2142files and matches snapshot result/terminal; original immutable materializer manifest c5178 remains exact. Snapshot terminal records the captured invocation and absent/empty cgroup.

4. Current ledger reconciles43200=16440charged+1800reserved+24960unreserved. Owner fence matches maintained heartbeat readback at2026-11-09T19:39:23Z; output directory was absent at review. Root maintains lease through launch.

5. Recipe-equality fields agree; four exact controls then full default-feature library suite are preserved. Total1800seconds,2CPU16GiB,10second permit,15second lease safety and absolute stop2026-11-10T05:11:39Z unchanged.

6. Source publication9c30e081 and receipt are bound. Exact final config plus this review still require publication/readback by root before the single manual attempt.

Argument and custody map



Reviewer authored v4 repair; this is an operational binding check, not a second independent source review. Independent source review f2cee314 by renew_materializer remains the source-fidelity evidence.

Remaining step: Root publishes/readbacks exact final configuration and this review, confirms live serial owner, then may perform the reserved single bounded attempt.

Inputs and precise hashes: review.json and snapshot/.

No new research claim; checked existing exact admission contract and prior v3 bindings.

Operational review uses retained receipts; no payload, compiler, cache rehash or cloud mutation was performed.
