Cover search and gluing applicability

Run `geometry-20261021T2256Z`; source freeze `d86eb011034066532d3645369a783f44be158b1c`. Host `a81fcf6dc864`, Debian 13 x86_64, managed four-CPU virtual host, L0. Workloads use public synthetic fixtures or public-parameter checks. No wall-clock or full-cost improvement is admitted.

Raw outputs: run directory. Commands, binary/input hashes, seeds, resource limits and statuses are in execution receipts and the versioned protocols in the study root. No independent-host replay is claimed.

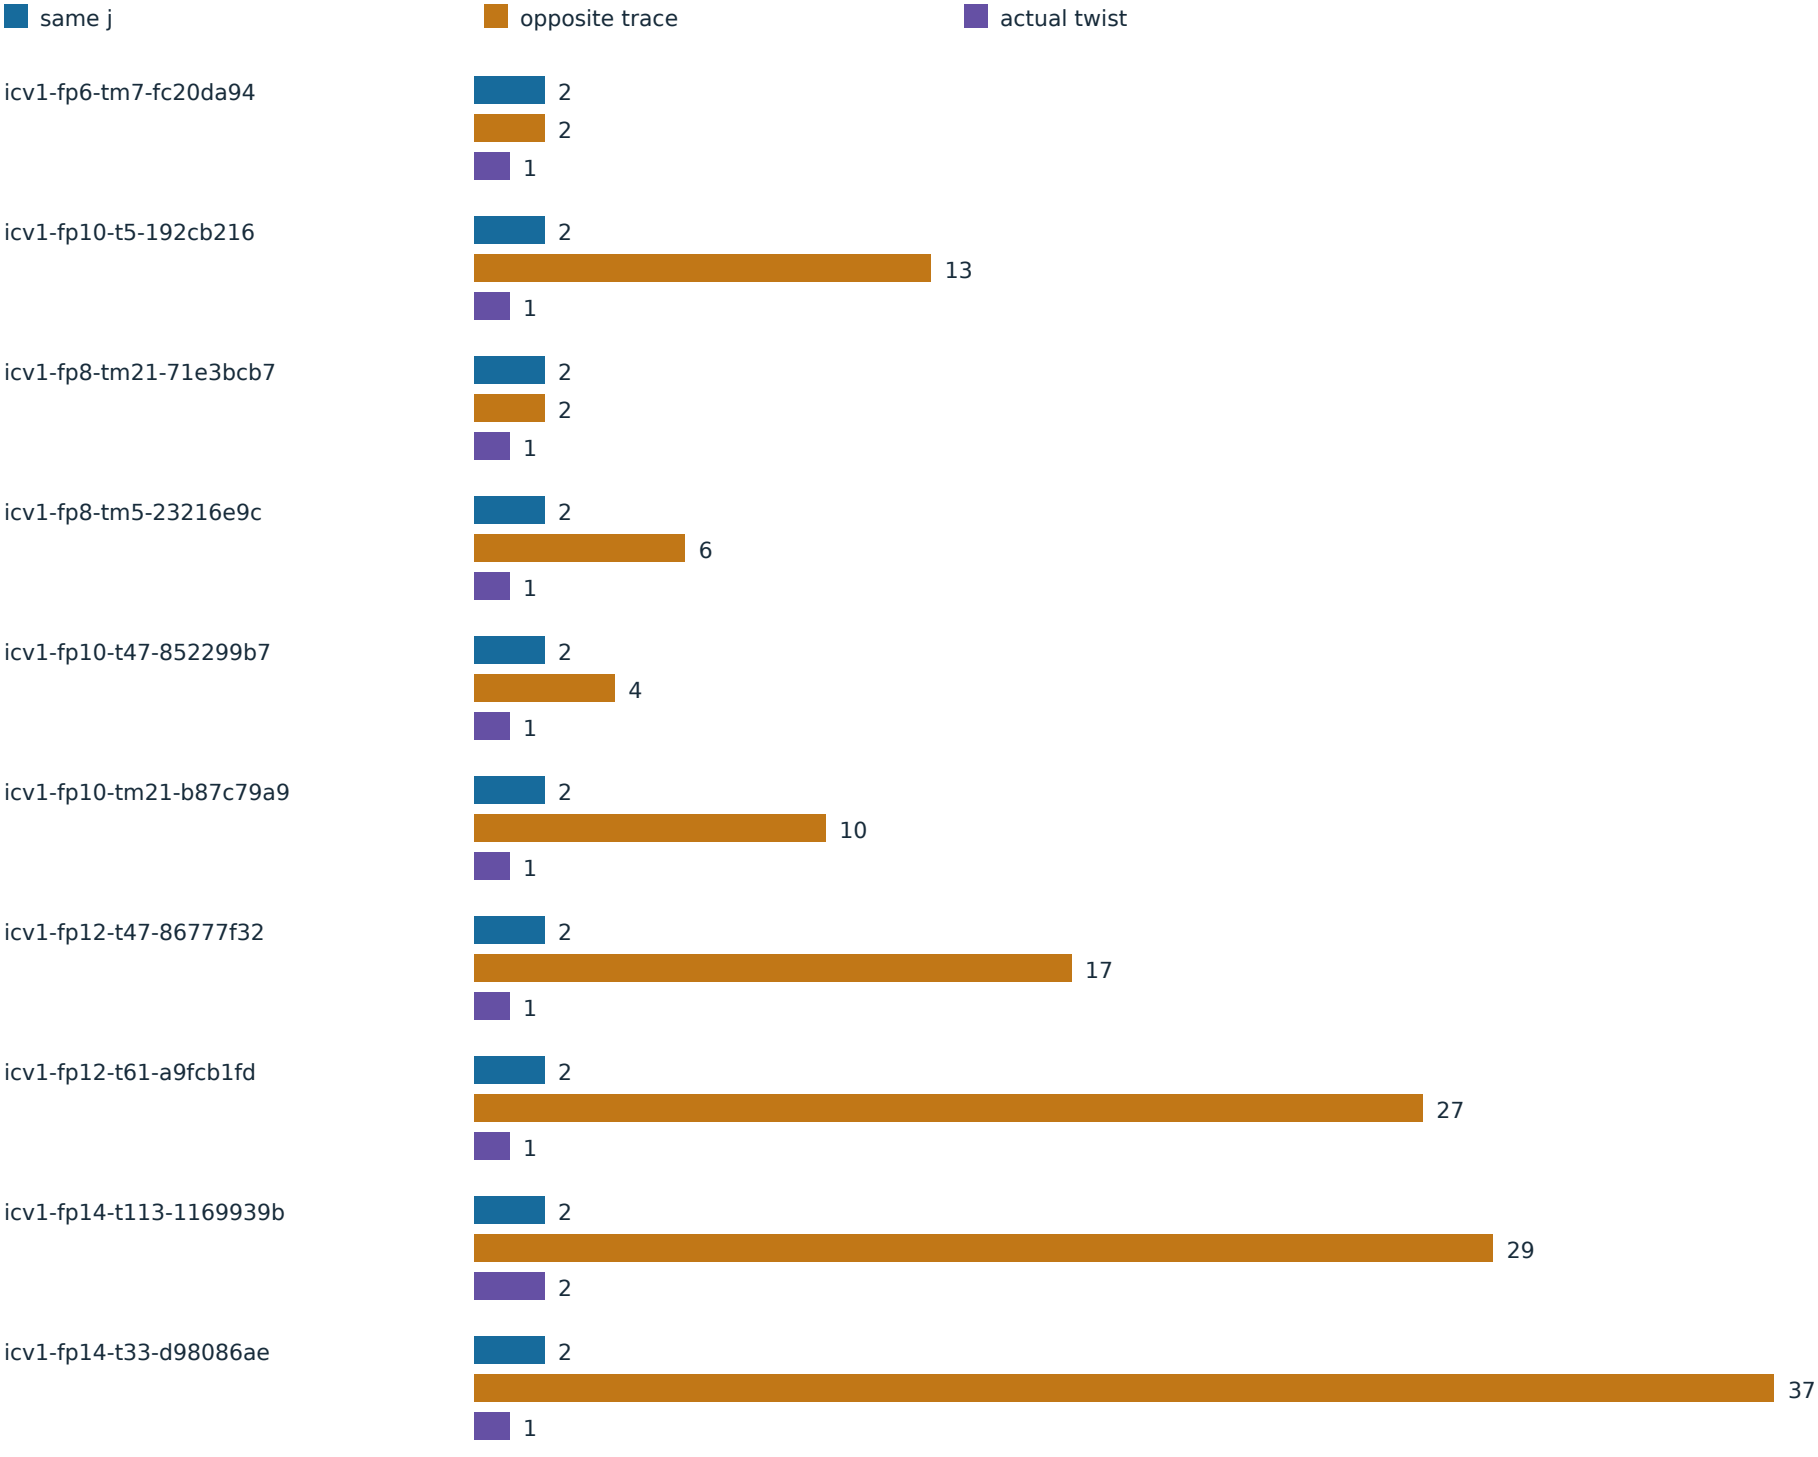
Recorded observations

Metric	Count / recorded value
actual twist complements	11
c parameters tested	27140
cover fixtures	10
three gluing constructible module cases left open	3

Vector figures and editable data accompany this report on the following pages.

All c in Fp were searched on each of ten fixtures. A matching j-invariant or opposite trace alone was not accepted as a twist isomorphism. E09 translated two-torsion cosets do not become rational points. Positive three-gluing module tests still need a quotient curve, polarization and class transfer; no nonexistence claim is made.

The chart has no statistical interval: census counts are exact on the stated finite sets; solver completion counts describe these bounded processes only. Missing or failed computations stay unresolved. Full original acceptance criteria and proof/measurement gaps remain in the requirement matrix.

Cover search and gluing applicability


Recorded counts; exact censuses or bounded run outcomes. No wall-time comparison.
