Pairing-control first attempt: no emitted result

Run `pairing-20261022T0020Z`; source freeze `0145df8ff32a104d186c31eca2f04c9ee256b21d`. Host `a81fcf6dc864`, Debian 13 x86_64, managed four-CPU virtual host, L0. Workloads use public synthetic fixtures or public-parameter checks. No wall-clock or full-cost improvement is admitted.

Raw outputs: run directory. Commands, binary/input hashes, seeds, resource limits and statuses are in execution receipts and the versioned protocols in the study root. No independent-host replay is claimed.

Recorded observations

Metric	Count / recorded value
GP exit code	0
accepted independent logs	0
parsed result	false
public target controls	10

Vector figures and editable data accompany this report on the following pages.

The GP function definition consumed its output statements on the same line. GP exited zero with no result. This attempt is unresolved and supplies no independent pairing-validation claim. V2 isolates the function definition and retries the identical inputs in a new directory.

The chart has no statistical interval: census counts are exact on the stated finite sets; solver completion counts describe these bounded processes only. Missing or failed computations stay unresolved. Full original acceptance criteria and proof/measurement gaps remain in the requirement matrix.

Pairing-control first attempt: no emitted result

Recorded counts; exact censuses or bounded run outcomes. No wall-time comparison.
