Actual 3-torsion and compatible graph inputs

E18; 2026-10-23; local bounded evidence, L0.

Four sources now have explicit full 3-torsion over a specified degree-four extension. Rust verifies pairings, both Frobenius matrices, all anti-isometries and graph points; independent PARI replay is accepted for each source.

The corrected GP emitter leaves the native certificate rows unchanged. Earlier malformed GP attempts remain preserved. Public P-521 work is parameter/torsion verification only.

Source	Extension degree	Anti-isometries	Nonzero torsion points	Bilinearity checks
p=211	4	4	8	81
p=751	4	4	8	81
p=10111	4	4	8	81
P-521	4	4	8	81

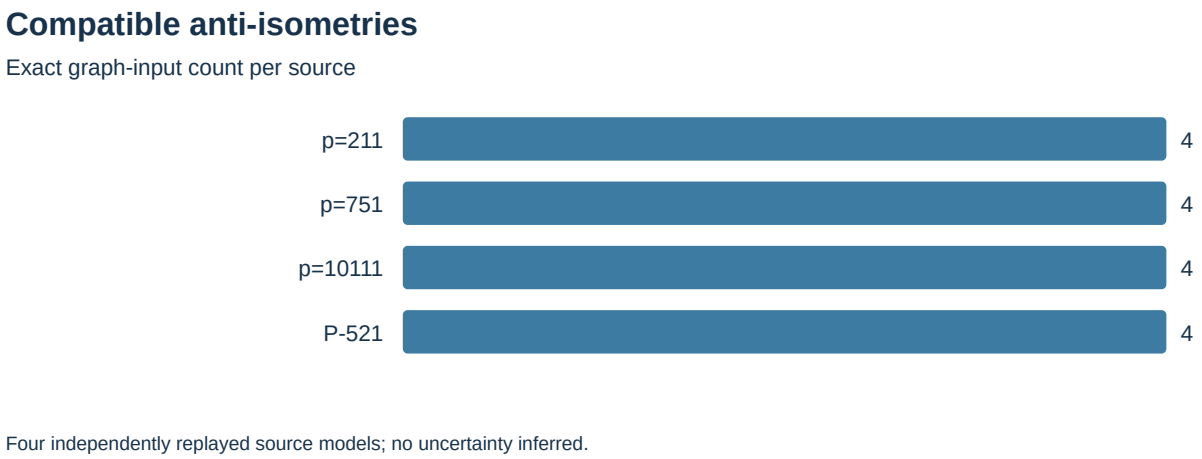

Figure 1: E18: four anti-isometries on each of four sources.

Actual torsion inputs do not identify an indecomposable polarized quotient or supply a faster destination solver. Canonical extension identity registration and full formal bridges remain open.

Verified locally; complete raw publication awaits artifact-store access. No calibrated speedup, novelty, independent-host replay or NIST DLP is established.

Native assessment: ../../execution-v2/assessment-20261023-v3/ASSESSMENT.json. Raw members: runs/torsion-*-20261023-v1 and -v2, all GP attempts and adjudications. Source/input/binary hashes and exact argv: E18-receipts.json and ../../execution-v2/receipts/.

All phase receipts, including errors and timeouts: E18-receipts.json. The complete execution ledger and original protocols retain actual limits and missing measurements.
