Concrete Frobenius replay and a partial Lean bridge

E29; 2026-10-23; local bounded evidence, L0.

The finite replay checks 71326 actual power-Frobenius point cases and 71178 twist-embedding addition pairs across the ordinary and control fixtures. It checks odd-component projectors, composite-order inversion and explicit even two-torsion exceptions.

The new Lean project constructs F59 and its quadratic extension, proves the concrete field Frobenius identities and additivity on the actual Weierstrass point group, and proves conditional odd-order cancellation. Its durable replay audits 17 exported theorems: zero failures and zero trusted/native_decide declarations.

Fixture	Extension point/Frobenius checks	Twist addition pairs	Odd projector checks
p=59	3551	2809	3551
p=67	4608	5184	0
p=113	12992	13456	0
p=223	50175	49729	50175

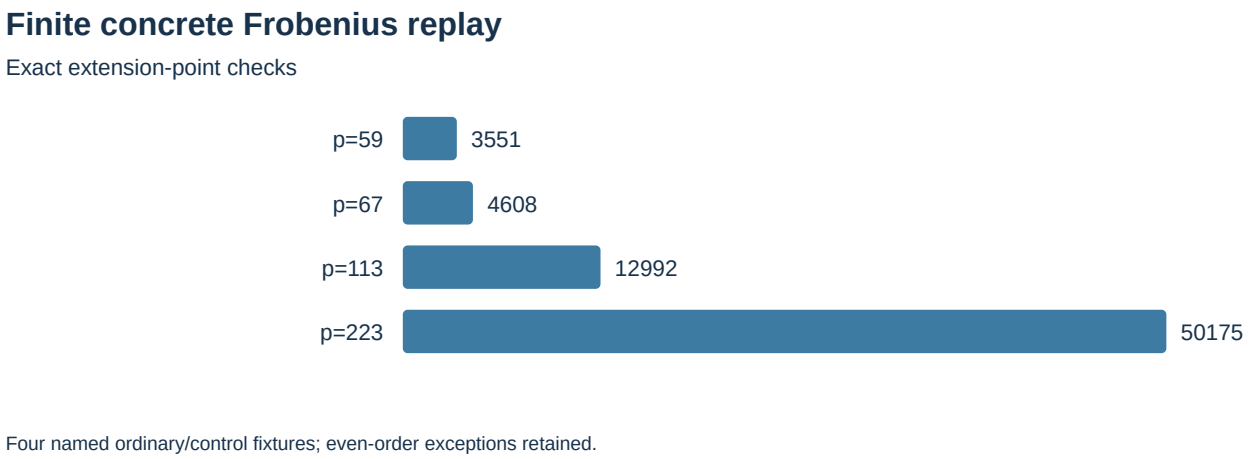

Figure 1: E29: finite coordinate replay and partial formalization have different scopes.

The exact twist point-group embedding, concrete odd-subgroup/projector identification, integer-to-prime-field row module and Rust serialization bridges remain open. The full E29 theorem is not claimed complete.

Verified locally; complete raw publication awaits artifact-store access. No calibrated speedup, novelty, independent-host replay or NIST DLP is established.

Native assessment: ../../execution-v2/assessment-20261023-v3/ASSESSMENT.json. Raw members: runs/projection-20261023-v1; lean-v2/receipts/resume-20261023-v1. Source/input/binary hashes and exact argv: E29-receipts.json and ../../execution-v2/receipts/.

All phase receipts, including errors and timeouts: E29-receipts.json. The complete execution ledger and original protocols retain actual limits and missing measurements.
