Prospective continuation amendment review

31 October 2026 UTC. Design review only; no freeze, runtime qualification or execution admission.

Preserved contracts. The draft retains 25,200 cumulative active-worker seconds and the absolute deadline 2026-10-31 06:00 UTC as planning-only limits. All eight referenced source hashes match. Exact workload/seed/arm plans, 36 pricing cells, prior failures, null incomplete ratios, individual cold/online timing checks and separate finite/timing admission remain intact.

Changed-instrument decision. The known C1 stop remains in force. A diagnostic-only instrument change does not itself authorize another gate. A prospective decision must explicitly permit the proposed single information-seeking gate, bind the changed instrument and equivalence review, and retain the unchanged mathematical solver/caps and prior C1 failures. The draft correctly leaves that decision pending.

Infrastructure attempts. The proposed maximum two infrastructure attempts and one scientific gate attempt require operational definitions before freeze. Specify total-attempt counting, observable payload start, post-spawn partial work, preemption, ambiguous timeout/exit137 and failure after completed rows. Authenticated evidence must establish an infrastructure cause. Scientific caps, watchdog stops, wrong answers and invalid outcomes cannot be relabelled infrastructure. Retain and charge all partial work; freeze permitted same-input restart behavior without replacement of missing rows. Unknown cause should stop pending review.

Feasibility boundary. Eighteen gate slots at 3,600 seconds allow 64,800 seconds; fifteen replay slots allow 54,000 seconds, totaling 118,800 seconds (33 hours), before other work. This is maximum-cap arithmetic, not expected runtime or a lower bound. It shows that per-slot ceilings do not guarantee completion within seven worker-hours. Actual remaining credit is null. Bind the live ledger and decide whether a bounded, possibly incomplete gate is acceptable. The 1,800-second collection reserve is not measured assurance; tighten cutoff when actual grace/collection needs require it.

Timing and reuse. Preserve all five individual A/A checks for cold and online, L2 isolation, and exact online phase sum with error=null. Prior p739 finite reuse requires original fresh-row replay or reviewed equivalence; the 900 computation reproductions alone do not qualify those rows. The full timing objective still needs qualified clocks for those 60 targets. Additional validation remains charged.

Remaining bindings. Source, toolchain, binary, image, controller, owner, request and analysis identities; runtime and terminal-custody qualification; canonical protocol validation and freeze; actual owner ledger, reservation, prepared session and context subset. Static binding success cannot authenticate custody or admit execution.

Disposition. The field proposal preserves the main contracts but remains unready for freeze/admission until these decisions and bindings resolve. This review ran no build, scientific trial, cloud action or canonical validator. Exact source hashes, findings and assumptions are in review.json and custody.json.
