Publication custody snapshot

31 October 2026, 00:24:23–00:24:50 UTC; additive forest checks recorded separately. Read-only scope: followup-continuation-v2 and canonical Lean modules.

Initial custody maps	32
Included files with matching bytes and hashes	798
Explicit omissions	96
Artifact-managed included files checked	18
Additive forest maps / included files	2 / 12
Canonical Lean modules matching reviewed source	13
Resolving README/index link occurrences	35
Checksum discrepancies	0

Local retained bytes and artifact manifest pins were checked. This audit did not download remote objects; remote durability/readback is not independently asserted. Existing custody maps did not change during the initial snapshot. Later additions remain outside the dated observations.

Publication action. At the snapshot, geometric-cycle-obstruction/archive.jsonl was 568,983 bytes and lacked an artifact manifest. Store policy needs application before staging. Other oversized hits belong to relation-adapter/target build cache and should be excluded, not stored. The checked binary path was not ignored by git, so use explicit staging exclusions.

Status and links. README explicitly retains root typed tests as in progress; no final Rust-check success claim was found. Historical STATUS open threads lag completed graph and recovery reviews; append a current status update. All reviewed links resolve and all 13 canonical Lean sources match reviewed producer or replay copies.

Evidence. snapshot.json records initial map hashes. included-checks.json lists each byte/hash check. audit.json records counts, links, source matches and size observations; addendum.json covers the two additive forest maps and final WeightedSameSupport reference. No root edits, builds, external jobs or scientific runs occurred.
