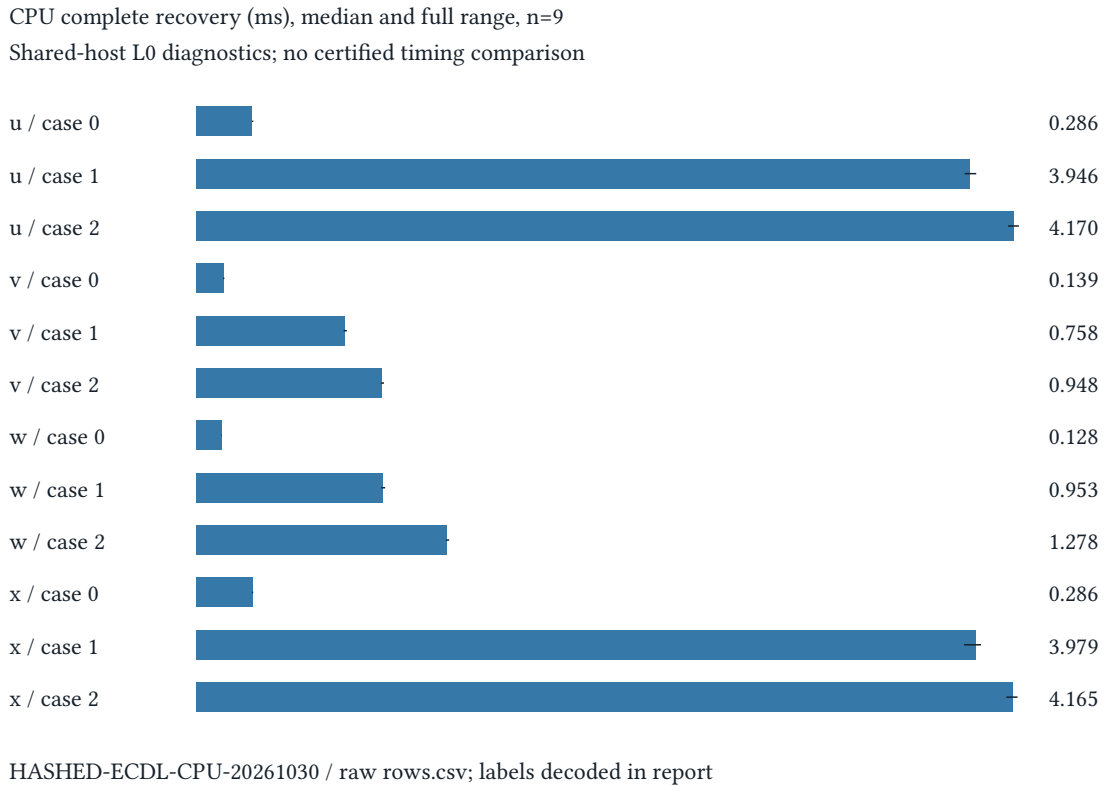
CPU projective fixed-base screen

Observations only; no certified latency claim or hypothesis promotion. Run: `hashed-ecdl-cpu-round7-20261030`, October 29, 2026 PDT.

Baseline u is the optimized CPU implementation at `2bd4588fba60`; candidate v is `633a1b285c08`, including projective fixed-base evaluation and batched table normalization on top of sparse pivots, reciprocal arithmetic and cached MITM tables. Candidate w uses batch 1. This is a bundled comparison with unchanged inputs and output semantics. Host: AMD EPYC 9R45, one software thread, 2 vCPUs / 4 GiB reserved; shared EKS VM, L0. Compiler and release settings match across arms.

Fixture	Baseline u, ms	Candidate v, ms	A/A x, ms
8-bit / 3 slots	0.285691	0.138670	0.285861
16-bit / 3 slots	3.946047	0.757573	3.978737
16-bit / 4 slots	4.170487	0.947734	4.164907

Recorded medians from 9 repetitions after 1 warmup. Derived u/v median ratios: 2.060, 5.209, 4.400. These do not meet the further 10x target and are not strict-isolation performance evidence. Do not pool durations with other hosts.



All 120 executions completed: 108 measured, 12 warmups. Complete certificate bytes agree across arms. Every execution checks its known scalar, replays the certificate and rejects a corrupted scalar. The frozen native analyzer and file-verifying export check pass. No failed or missing cells were discarded.

Complete intervals include constructor and known-target setup, scalar/MITM tables, all attempted trials, relation collection, elimination, both certificate checks and serialization. Process launch, archive I/O and negative control are outside the clock. Table capacity counters are not total peak RSS.

The candidate uses Jacobian mixed addition with explicit exceptional cases, one normalization per fixed-base evaluation, and batch-normalized table windows. All 27 release tests pass, including exhaustive scaled small-curve pairs and independent affine binary scalar checks on small and 40-bit curves. This bundled panel does not identify either change's separate contribution. Largest feasible CPU scale, matched rho/external comparisons, strict isolation and independent review remain unresolved. The 20–40-bit ladder remains separate.

Protocol: `7f161ff5aa8e45865d46dd5d9ab5898070e5d0dd5cc05d4d6467c6be1ef63684`. Raw rows, summaries, certificates and checked export: `round7/results/`. Build identities: `round7/results/build.json`; terminal receipt: `round7/status.json`.
