B-zero UInt64 branch correspondence

Producer checks passed; independent review pending.

Two declarations compiled. Fixed controls and separate axiom readback passed, reporting only `propext`, `Classical.choice` and `Quot.sound`. The field-level dependency also remains pending independent review.

Proved component

The exact-associated word trees for n_1, n_2, B, x, y, z, w decode to the retained field expressions and remain canonical. Under original validity, canonical inputs and curve coefficients, nonzero input weights, literal $B = 0$ and $s \neq 0$, and explicit global coprimality, the selected doubled output is canonical, has nonzero weights and retains normalized Mumford validity.

The statement requires a prime $5 \leq p < 2^{31}$ and the degree-one route without lookup tables. It reuses the existing explicit no-overflow arithmetic bridge and literal-five doubling treatment. The restricted dispatcher uses None outside this branch; those markers are not claims about other native branch payloads.

Fixed positive and boundary controls

At $p = 5$, curve coefficients $(0, 4, 1, 0)$ and input $(q, r, s, t, z, w) = (1, 0, 4, 0, 2, 3)$ give $B = 0$. The point is $(x, y, z, w) = (4, 4, 3, 3)$, normalizing to $(1, 1)$ using x/z^2 and $y/(z^5 w)$. The doubled raw payload is $(2, 1, 3, 2, 3, 3)$ in (q, r, s, t, z, w) order. The complete original-input proposition was checked, including its coprimality certificate.

Additional controls check the zero-s route, a nonzero-B route, a noncanonical input and exclusion of $p = 2$. Machine-readable inputs, outputs and coordinate order are in `control-data.json`.

Evidence and limits

Main attempt2, field-fixtures1, controls1 and readback1 passed. The failed first main attempt is retained; it exposed a simplified numeral bound and a record-wrapper projection mismatch. Passing files retain tactic-style warnings. No scientific payload, timing measurement or cost ratio was generated. No canonical integration has occurred. Independent literal-source and statement review is the next required step.
