Same-u mixed extraction: field validity

Original input congruences → exact product identity

Noninverse + nonzero slope difference → support root

Literal weighted extraction → same normalized point, nonzero z/w

Seven lemmas compiled; controls and separate readback passed

Singular boundary: f=X^5, u=X^2, v1=X, v2=2X

Extracted y=0; following native doubling weight 2y=0

Validity alone does not supply a nonzero doubling weight

Next: local nonsingularity and word/guard composition

Independent review pending; failures retained; cost ratios null
