Independent C0 curve-point review

Reviewer /root/monic_review. 2026-11-01.

Result. Twelve producer declarations and ten controls passed fresh replay. The reviewer also checked a general normalized source-ordinate identity and four boundary fixtures. All 27 named readbacks pass with standard axioms. No mathematical defect found in the scoped construction.

Quotient independently derived. Before proof-body access, the reviewer derived that U_1U_2 is monic degree four with next coefficient q_1+q_2. For $l = v_1 - aU_1$, residual $f - l^2$ has degree five and coefficients $1, -a^2$ at degrees five and four. Divisibility supplies a witness; coefficient comparison gives quotient $X - (q_1 + q_2 + a^2)$. Producer proof follows those steps and never assumes the quotient formula.

Output. At $x = q_1 + q_2 + a^2$, evaluation proves $f(x) = l(x)^2$. Source ordinate is $-l(x)$. Prior coprimality/interpolation lemmas supply product divisibility from original input residuals and the C0 branch conditions. The case $a = 0$ is included.

Normalized source identity. At input weights one, native $X = (q_1+q_2)B^2 + A^2$, $Z = B$. Native degree-one normalization divides y by Z^5, not Z^3. A fresh general field identity proves literal source $Y/B^5 = (A/B)(x^2+q_1x+r_1) - (s_1x+t_1)$ under $B \neq 0$. This connects the sign and ordinate formula beyond their squared curve equation.

Weighted boundary. Arbitrary weights require common scales $Z = z_1z_2$, $W = w_1w_2$, $BW = bbW$ and nonzero denominators. The source-first weighted expansion is recorded but not certified here as full weighted/word/compiled equivalence. Smoothness and divisor-class addition are also not conclusions of the point-on-curve theorem.

Controls and provenance. Reviewer fixtures include zero/nonzero a, necessity of coefficient4 zero and ordinate sign. No reviewer failures occurred. Existing imported helper binaries retain their trust boundary. Source-first local plan and fresh named checks completed; precommitted publication, full dependency rebuild, independent kernel/multi-reviewer gates and coordinator delivery remain separate. No scientific execution.
