Renewed pencil campaign: accounting and reservation

The explicitly renewed allowance is 25,200 active-worker seconds from November 3 at 17:39:17 UTC through November 4 at 06:00 UTC. Historical records remain unchanged. This packet records a proposed reservation; execution is not admitted.

Worker accounting. Scoped live observations and team launch attestations support zero post-renewal runtime/cohort workers before this reservation. Fourteen pencil state objects retain October 30 modification dates; the current overview contains no pencil Job; the identified C1 controller is complete and its instance query returns no instance. These are scoped observations, not an account-wide usage audit.

One proposed attempt. Maximum 600 seconds, 2 CPU quota (1,200 CPU-seconds), 2 GiB RAM, 4 GiB retained storage, one attempt. The optional stricter policy debits 1,200 worker-seconds, leaving 24,000. Storage remains reserved through qualification or reviewed disposition. Independent review accepts the scoped worker accounting.

Separate software overhead. Known command ceilings and partial elapsed observations are retained in JSON. Rendering, hashing, transport and some wrappers were not globally metered; total software overhead is unknown, not zero. Independent mathematical proof work is not silently reclassified as matched-cohort worker occupancy.

Dollar observations. The larger daily reading is USD 131.13 against USD 200, updated November 3 at 17:40 UTC. Monthly spend is USD 320.369 against USD 1,000, updated at 11:06 UTC. Daily thresholds are nonadditive. These delayed observations leave a shared unreported-spend margin and finite host/storage allocation to reconcile before final build admission. A regional instance inventory is retained with its exact scope.

Reproducibility. reservation.draft.json binds the planning record and assembly inputs. budget-observation.json preserves parsed observations; independent-review.json retains the review. allocation.csv and this renderer reproduce the planning graph. This packet contains no new cohort measurement or runtime execution.
