Finite fields F -> K; extension B/K; compatible embeddings
q = |F|; k = [K:F]; actual |K| = q^k
Actual scalar endomorphisms
K-Frobenius restricted to F
equals F-Frobenius to power k
Actual Point.map functor
Map of a power equals
iteration of the actual point map
Actual point descent
P comes from W(K) iff k iterations
of F-Frobenius fix P
Entire actual r-torsion set
Contained in the K-point image iff
the k-fold point iterate is identity
Remaining qualified BK obligations
Actual torsion rank / determinant / Weil necessity
