Actual original norm / membership model
Same public curve and target; weighted core coefficients
Explicit inverse pair: e*l = 1
Compose with l^2*X; no finite-field evaluation shortcut
Actual norm scales by e^12
Target factor by e^2; support quotient by e^10
actual division uniqueness
Every Dickson depth: d = 2^(n+1)
Actual full remainder scales by e^d
actual polynomial coefficients
Coefficient j: exact normalization e^(d-2j)
PCC-20261114-9e7aa6 (unsigned)
Graded-polynomial / initial-form interpretation
Stronger constant vanishing still separate
not transport of a solution
e = 0 endpoint
Separate special-fiber theorem; no inverse pair
Weighted closure / normal-form degree bound
Growing-family expected bit cost
