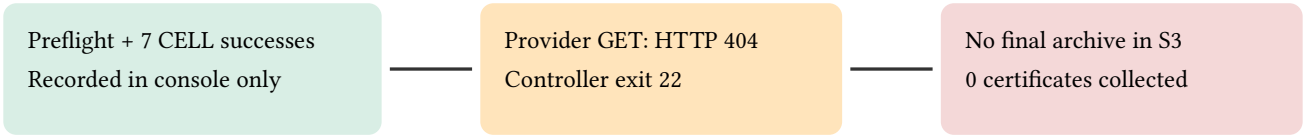
V16: completed work reported, archive lost

The worker console reported six 52-bit completions and one 63-bit completion. The pod disappeared before the final archive was uploaded. These are retained console observations; certificates could not be collected or independently audited here. No audited recovery rows are manufactured from these messages.



V16: 8 prescribed cells; 63-202-u outcome unknown; no task pod remains.

Recorded work

All eight query variants completed memcheck/racecheck/synccheck preflight; host arithmetic/filter checks and 26 Rust tests passed in the console. The six 52-bit CELL messages reported total seconds:

Seed	Baseline b	Filter u	Repeat x
101	14.922	4.904	4.906
202	17.726	5.454	5.453

The 63-bit seed101 message reported 1148.950 seconds, oracle1146618.757783ms and linear2025.645493ms. Seed202 outcome is unknown. These rounded values are copied from console messages, not reconstructed rows. Protocol clocks are L0, wall_valid=false. No statistical timing claim is made. The diagram shows the interruption; a recovery plot is omitted because its certificate and row archive is missing.

Failure and custody

Provider GET returned404; cleanup DELETE also returned404. A fresh complete inventory contained no task pods. Controller exit22. Worker exit, final GPU telemetry, TABLE/cache sizes, certificates and final archive hash are unavailable. Cause of disappearance is unknown. S3 listing showed only source-checkout.tgz.

Pod `omb2jpo4ntoq5g` started2026-10-30T20:20:06UTC inUS-NC-1 atUSD2.49/hour (provider rate, not final bill), using one RTX PRO6000BlackwellServerEdition. Source: `23dc8a61ca928e47237f8fb5a3a8d87228649628`. Protocol SHA256: `fe424abdd265c0ded0c191edf1c36810d86a87163502a1497c2da43ffece378f`. Command: `bash research/explicit_relations_e2e_20261030/run-filter.sh`. m8; seeds101/202; rows2^32, work2^34, chunk2^20, columns16384, trials16; 52/63-bit solve caps180/7200s, replay60, worker18000/controller18300.

Raw records were pushed in `43d32aa4c087` before this report. `interrupted-v16/interruption.json` and its hash-store manifest bind the exact console bytes, receipts and scripts. The full SSE remains under `validation/ecbench-explicit-x/e2e-20261030-v16/logs-interrupted.sse` in the approved artifact bucket. V16′s one-attempt execution is closed.

Collection improvement

V17 keeps its frozen source, targets and bounds. A dated collection addendum adds partial artifact uploads every60s and reconciles failed status reads against complete inventories. Copies are evidence backups, not restored solver trials. Host I/O is additional background work; all arms retain L0 clocks. Final certificates still require replay. V17 compares8,10,12slots to reduce relation counts.
