Preparation: saved-work parser

27 October 2026. One strict C++17/O2/Wall/Wextra/Werror build passed, followed by exact synthetic-count, unknown-preservation and seven rejecting integrity controls. No historical transcript was analyzed during these controls. The command, compiler text and outputs are in controls/ and the preparation archive. The plan was frozen with all labels and one example format visible.

Preparation before analysis001

Preparation only; no comparable clock observations or historical samples

This diagram describes preparation rather than a cost graph: the controls are different integrity cases, not comparable timed workloads. Host hardware, isolation tier and runtime/RSS were not recorded or admitted. No seed, clock, reference performance arm, legacy execution or DLP applies to this parser development. Build/control status is zero; there was no failed native build.

Source/restoration commit 83bbc8d85ab1454e0ff299b88fb83fe746891d30 and receipt commit b1f58e9d8e08bb3a9e1794166cd69e7556bbffa3 precede the primary invocation. The binary SHA256 is ebcf49771292c5410942988755b775b70d371bcd9e9cb9d6ff53206c49b11edc. The preparation archive has27 files,116856 bytes and SHA256 528820c56c13db464a12a93523eedf7448d0d2e150729d6da471e6e66bd67e9d. Full remote GET and all-member verification passed before primary execution. Raw evidence: controls, protocol, plan, delivery receipt.
