## Research EKS capability probe

Job twist-joint-capability-20261024-v1 has UID ee711fcc-27b1-47cd-be6b-5c78b068ccc1. Its accepted submission starts 2026-10-24 00:50:10 UTC, using the existing scoped job-submitter role, two requested CPUs, 2 GiB and the 60 s job deadline.

The pod remains unscheduled because the available nodes do not match its affinity. The job reaches DeadlineExceeded; no benchmark command or scientific computation executes. An earlier one-CPU request is rejected by validation before any job is created. Saved submit, pending and terminal status JSON are in runs/cloud-capability-v1/.

The probe is terminal and was not repeated after migration reconciliation. No role, IAM permission or node-pool policy was expanded. An unscheduled job supplies no mathematical, runtime or solver evidence. With no comparable executed measurements, the visual is an explanatory diagram.
