Upper gate: terminal checkpoint observations

Run: pencil-p186379-20261030-b1. Caller-supplied source commit: 543a54b4b1c3be7052872af3ffe393a44c69a3c3.
Observations only. No statistical, speed, mathematical or timing qualification is inferred.
One archived public synthetic mathematical target; terminal controller deadline failure. Computation observations only; no measured comparisons.
Workloads: 1; expected pairs per price cell: 5; slots: 18; observed: 2; missing: 16.

Recorded outcomes

rho:verified: 1
rho_AA:verified: 1
Missing rows remain missing; capped, timeout, error and other outcomes retain their original labels. Counts from different epochs are not pooled.

Pair coverage by price cell

Workloads: 1; expected pairs per price cell: 5; slots: 18; observed: 2; missing: 16.

Arms: pencil, rho, rho_AA. Planned slots are not observations.

Fewer than two comparable ratio cells are present. Diagram of planned scope and observed progress; no performance plot.
The controller stopped with original UTC deadline expired. The inner ecbench session retained in checkpoint generation6 still says running; it has not been relabeled completed.
Two observed rows are rho and rho_AA warmups. No pencil record and no measured record were retained. Sixteen of eighteen planned execution slots are missing; all five measured pairs are unavailable.
All36 finite-model ratios are null. Missing pencil work is not a zero-cost measurement or a completed failure row. No scientific or timing admission follows from this packet.
Checkpoint generation6 was written; no restore occurred. Per-record attempts1 and resumed0 derive from terminal controller attempt0/restores0 plus the generation manifest.
Instrument source commit543a54b4b1c3be7052872af3ffe393a44c69a3c3 and binarya1c8ca89748a22b8a07ea00fd3983061be0d8197d5cae49fca883dcf5dd50eab are distinct from session artifact-child git_commit7d7f5495c5b85ae426efdbcb721b6faf72c1be14.
Computation isolation is L0 and clocks remain unqualified. No fresh benchmark epoch was created. Controller/worker allocation observations are separate; none are converted to finite algorithm cost units.

Separate resource observations

No conversion to algorithm cost units.

{"controller_end_utc":"2026-10-30T03:28:38.987000+00:00","controller_phase":"COMPLETED","controller_status":"FAILED","cost_conversion":null,"schema":"pencil-upper-terminal-resource-observations/v1","scope":"Controller metadata only; worker lifetime and cumulative resource reconciliation remain pending.","supervisor_status":"stale running snapshot; not shutdown evidence","worker_elapsed_seconds":null,"worker_termination_verified":false}

All36 exact price cells

S2 is twice S/M; N10 is ten times the native event price. Incomplete/unavailable ratios are null, not zero. Partial admitted sums are retained in JSON as diagnostic only; no partial sum is promoted to a complete ratio.
