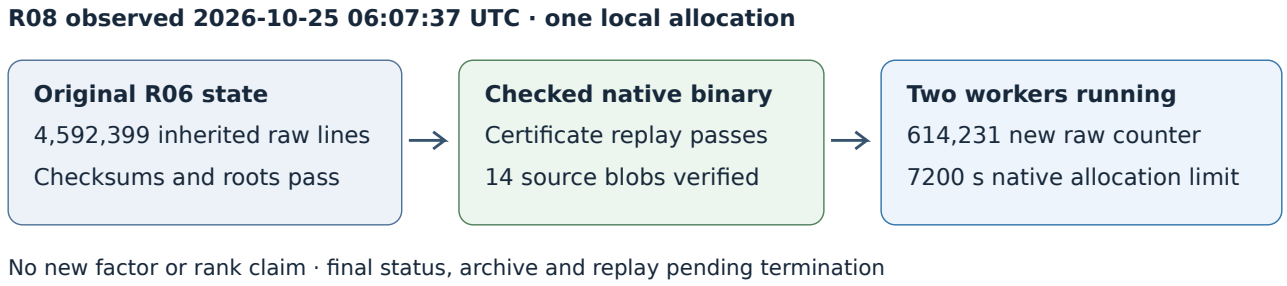
R08 interim: longer local collection is running

At 2026-10-25 06:07:37 UTC, native PID 9409 and two lattice-sieving workers were running. The observation records the actual command and process state. It reports 614,231 raw relations for this allocation only, excluding the inherited 4,592,399 lines. This is a dated observation, not a claim that the bounded worker remains alive indefinitely.



The diagram describes one allocation. Inherited main-file lines and new per-allocation counters have different scopes; no comparative throughput, rank or completion-time estimate is given. The current configured request for 41,407,601 relations is not a sufficiency guarantee.

R07 completed filtering of the prior dataset and left 92 singleton survivors with no matrix prerequisite. R08 therefore continues R06's original state, not the filter-modified copy with appended free relations. The input relation SHA-256 remains 1c4926cfcb63c8821ef209ebad4d3b0562980f73807574a8e32b3201430cced9. The range ledger and both native polynomial formats match the predecessor. The quarantined old worker output stays outside active state.

The exact skipped_256_876-twist2 residual remains the same 444-bit integer bound by the protocol. Fresh baseline certification and a separate whole-target prime/product replay pass. Fourteen copied runtime source blobs match immutable commit 5cb553810e5bbfbd8691ec614ffcaacefc625757. The validated patched executable matches its binary-bound native timeout control. Subsequent branch edits cannot alter this running source snapshot.

Production launched at 05:51:25 UTC; native sieving began at 05:52:08 UTC on October 25. Two workers use seed 20261022, -gnfs -xover 81 -pbatch 120, native limit 7200 seconds, outer 7260 seconds plus 30-second kill grace, 4 GiB virtual memory per native process, and 1 GiB per output file, with core dumps disabled. Host allocation is four CPUs and 16 GiB RAM, L0. At least 1 GiB free disk was required after state preparation. No R07 filter-dispatch override is applied to production.

Stop on a certified result, native failure or configured bound. Exact commands, source hashes, pre-resume state, output and statuses are retained under /workspace/nist-factor-R08-20261025. Final status, full archive, post-run replay and completion report remain pending until termination. No new factor is claimed; eight of nine timeout integers and thirteen of fourteen fields remain resolved. Existing product proofs and certificates apply unchanged. No paid/remote machine, lease or task was launched; the distributed card remains draft/unqueued. Existing mathematical and IC performance figures have no changed conclusion and remain unchanged.
