Normalization source attribution correction 2026-10-31

T-1177. Producer correction and replay; independent fidelity review pending.

Four recent packets copied the first 61 lines of `projective_law_gate.rs`. Those excerpts contain none of `choose`, `transform` or `map_divisor`. The original loop packet bound `genus2_model_gate.rs`; its current full-file hash still matches the original record. The defect is source attribution and excerpt selection, not a demonstrated canonical-source change.

Affected packets, preserved unchanged:
`coefficient-array-storage`; `coefficient-traversal`
`traversal-polynomial-composition`; `scale-trim-storage`.
Use this correction's named canonical excerpts and source map for source review.

The extractor records exact line ranges and full-file/function hashes. It requires one function-header match and balanced braces, and checks that the selected bodies contain no strings or comments that could confuse brace counting.

Source	Function	Observed text correspondence
Related gate	choose	matches after out → x
Related gate	transform	matches after scale_inv → inv
Related gate	map_divisor	absent
State collector	choose, transform	byte-identical
State collector	map_divisor	matches after out → result

These are text comparisons, not compiler equivalence or independent semantic review. The mathematical statements and prior checks remain recorded, but the old excerpts do not provide the advertised source review material.

The unchanged Scale, Trim, Bridge, Controls and Readback modules were rebuilt in a fresh directory. The helper now also binds the intended canonical source, state collector, extraction script and source map. All five checks passed with unchanged input hashes. All 32 named axiom readbacks contain only standard Lean axioms. Existing compiled upstream dependencies remain within the trust boundary; this is a producer replay.

The additive packet includes this inspected PDF, editable SVG, structured status, full source snapshots, named excerpts and receipts. Earlier commentary suggesting canonical function movement is superseded by the source-attribution finding. Divisor-validity composition remains the next mathematical step. No scientific campaign, timing or cost ratio.
