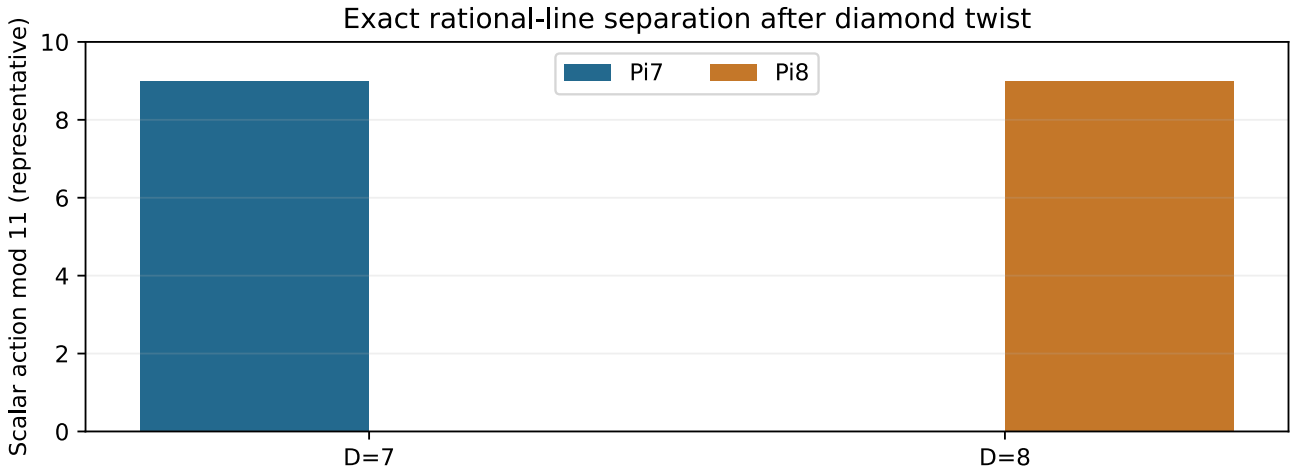
Koblitz transfers — R39

Integral source operators and independent degree-seven supports

Exact native observations, 2026-10-30. No IC performance or recovery claim.

The actual nonzero ordinary source eleven-class R=61E satisfies tR=7R. All eleven scalar possibilities are checked. The earlier prospective character-six expectation fails. Applying the quadratic diamond twist to the retained CM system gives distinct rational characters 7 and 8, even though two shared systems remain elsewhere.



joint39-01: complete finite check; no statistical uncertainty or timing measurement

With $Q(F,u)=F^2+Fu+2u^2$, the crossed operators are $Pi7=E(t)B(F)Q(F,t^7)Q(F,t^6)$ and $Pi8=E(t)B(F)Q(F,t^4)Q(F,t^3)$. Here E selects the mixed diamond component and B is the full twisted complement characteristic, with B(1)=3721. Exact global identities separate the CM components under both diamond conventions. Recovery scalar 5 inverts the nonzero rational action 9 modulo 11. See FACTOR_CONSTRUCTION.md for the full formulas, convention dependence and written geometric bridge.

The independent F128 chart collector finds 420 rational points, 60 closed points of degree seven and six diamond orbits. Original equations, eight units, descent, deck and Tate torsion controls pass. All 60 representatives also pass the source-bound local quotient test: 682 coefficient denominators and 27 omission/Jacobian products per case, with checked unit-ideal lifts. This certifies standard-etale presentations under the retained source bridge. It is a chart search, not a global proper-curve point count.

Lean proves abstract CM annihilator, twist and eleven-torsion recovery implications. Every compile and audit receipt, including rejected attempts, is retained in results.json. Native arrays and proper geometry are not formalized. Caps remain native 4GiB/1200s and Lean -j1 -M4096/1200s.

The chosen-Koblitz model map, sign binding, full saturation and polarized embedding remain open. Degree-seven jets and complete coupled collector divisors must precede reverse evaluation. R38 precision-615 source jets and the larger section spaces also remain unfinished. No IC relation rank, unknown-scalar recovery or speedup is established. Sources: R18 CM system; R27 incidence model; R33–R37 source/local/class certificates; R39 run inputs.
