Actual W, retained t, existing diagonal c
No nonzero local-first-jet premise
Construct actual bivariate D(H,Z), N(Z)
H=h evaluates to actual row denominator
Actual coefficient-H^b content >= b
Finite geometric sum + row-class identity
Truncate H degrees >= k
Whole-polynomial error k at actual integer h
Literal selector-moment left; coefficient right
2^u*k labels; right integral; scaled error w+k
OPEN: combined H/Z grade, degree/precision/bit/entry
Original mode density, recovery and full expected cost
