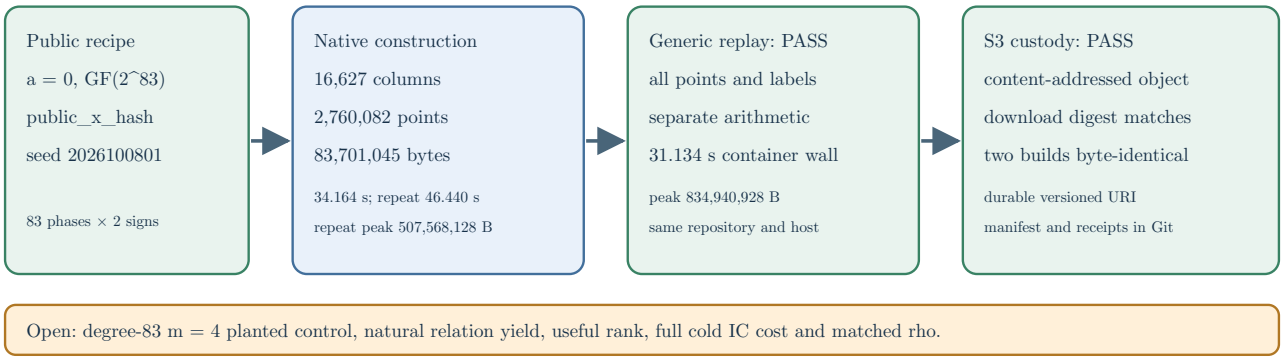
Stored N83 K = 16,627 signed-Frobenius base

2026-10-17 UTC · Primary a = 0 curve · Native public-x-hash recipe

N83 K = 16,627: prebuilt symmetric base



The exporter constructed one 16,627-column base with 2,760,082 signed Frobenius point records in an 83,701,045-byte compressed object. Its first descriptive construction wall was 34.164 seconds. A preregistered repeat produced byte-identical bytes in 46.440 seconds and measured a 507,568,128-byte cgroup peak. The first run's peak is missing.

The generic multi-limb replay checked every representative and point and passed; its cgroup peak was 834,940,928 bytes. The native uploader passed an S3 upload/download and compressed digest check. The exact object BLAKE3 is `1aa70cc1571f4cb25af42936699378329128a869f2ae8ad35efb375663d4e59d`. The manifests, replay, storage and container receipts are linked in `RUN_REPORT.md`.

The size was chosen from the m = 4 cardinality threshold. Its construction does not measure natural relation yield, useful rank, individual logarithms or complete cold IC cost. The next experiment gates the full-width m = 4 adapter and a degree-83 planted relation on this retained object. No factor-base winner or IC baseline change is selected.
