Higher-prime torsion inputs verified

E20; 2026-10-23; local bounded evidence, L0.

The necessary module filter covers 75 main rows at ell=5,7,11,13,17, with 15 ell=3 regression rows. It is not a geometric quotient test.

Five selected toy cases now have actual torsion bases, primitive Weil pairings, Frobenius actions and every compatible Galois-stable graph, checked in independent Rust and PARI arithmetic. The first constructor branch skipped the pairing test; its five failures are retained, and the corrected same-seed bounded replay passes.

Source	ell	Extension degree	Points per curve	Compatible graphs
p=827	5	8	25	6
p=751	7	12	49	8
p=10111	11	10	121	10
p=59	7	6	49	6
p=251	5	4	25	4

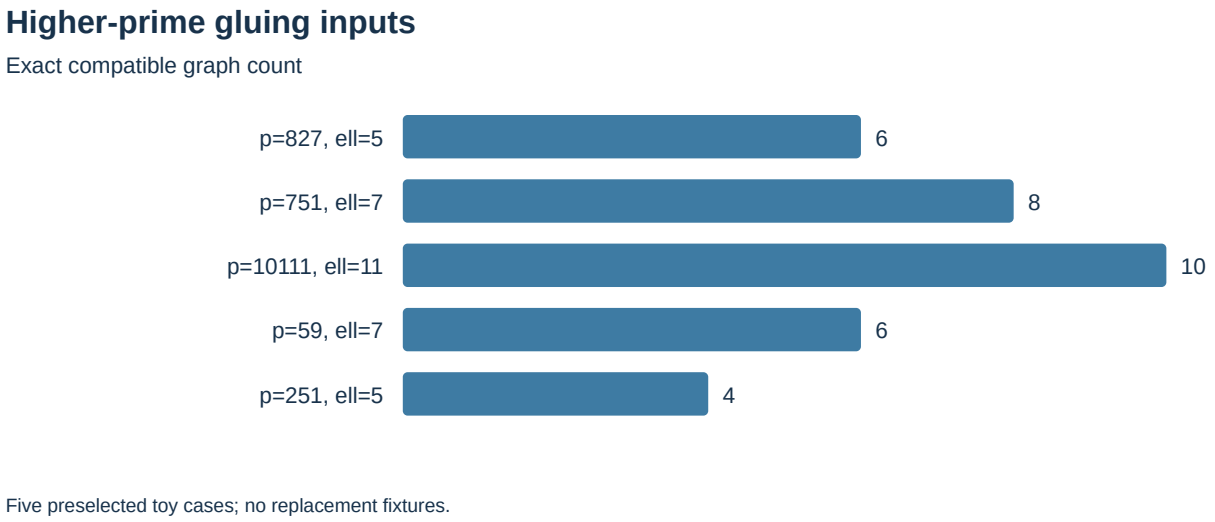

Figure 1: E20: actual graph inputs for primes 5, 7 and 11.

No ell>=5 quotient, polarized genus-two model or induced maps are constructed. No actual higher-prime NIST construction is claimed.

Verified locally; complete raw publication awaits artifact-store access. No calibrated speedup, novelty, independent-host replay or NIST DLP is established.

Native assessment: ../../execution-v2/assessment-20261023-v3/ASSESSMENT.json. Raw members: runs/module-20261023-v1, runs/higher-*-v1 and -v2, input and replay directories. Source/input/binary hashes and exact argv: E20-receipts.json and ../../execution-v2/receipts/.

All phase receipts, including errors and timeouts: E20-receipts.json. The complete execution ledger and original protocols retain actual limits and missing measurements.
