Projected additive-energy diagnostics

E22; 2026-10-23; local bounded evidence, L0.

The native assessment recomputes every recorded signed pair/triple histogram and additive energy, including 960 matched random-base controls. Distinct projected bases are deduplicated across configurations.

Duplicating every lift twice multiplies the weighted energy by 16 while adding zero new projected rows. That factor is an algebraic multiplicity calculation, not a measured rank gain. Energy alone is not a collector or a speed result.

Fixture, B=8	Independent public random seeds	Energy min	Energy max	Recorded mean
p=59	32	1288	1600	1395
p=211	32	760	1112	888
p=251	32	768	992	875

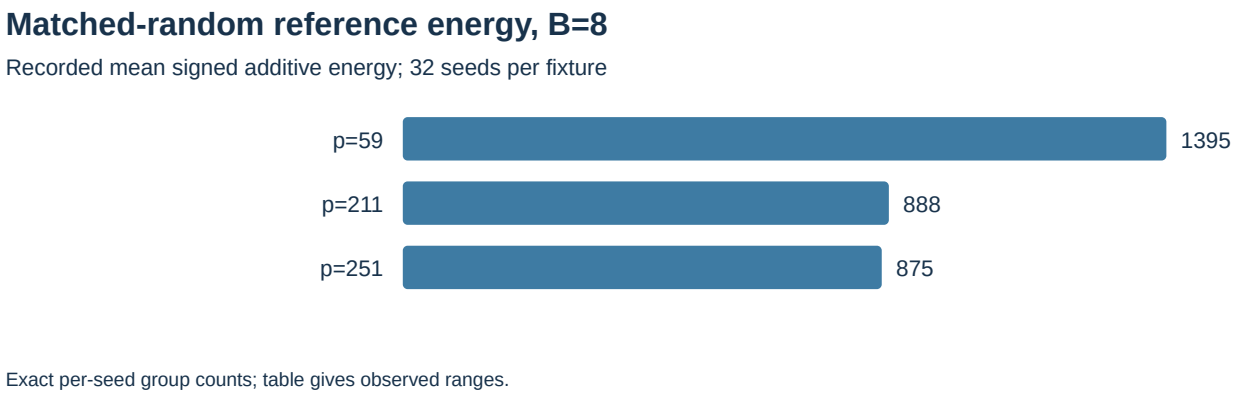

Figure 1: E22: reference energies are diagnostic quantities, not algorithm costs.

Full independent row-span/yield controls, shuffled and interval-like controls, frozen structural selection and complete collector costs remain open.

Verified locally; complete raw publication awaits artifact-store access. No calibrated speedup, novelty, independent-host replay or NIST DLP is established.

Native assessment: ../../execution-v2/assessment-20261023-v3/ASSESSMENT.json. Raw members: runs/coupled-energy-20261023-v1 (all 1,245 diagnostic/control entries). Source/input/binary hashes and exact argv: E22-receipts.json and ../../execution-v2/receipts/.

All phase receipts, including errors and timeouts: E22-receipts.json. The complete execution ledger and original protocols retain actual limits and missing measurements.
