V2 prospective continuation review

Independent operational source review

5 November 2026

Disposition: source adequate for the bounded attempt. Binds published revision `7ff045f7d095` and freeze `8a4966a5579f`. No native execution or new kernel validation occurred.

R1 addressed. Receipt decoding and status errors retain a failed compiler row. Post follows a failed compiler only with confirmed terminal ownership and sufficient remaining allowance. Unknown termination stops overlap; incomplete custody cannot pass.

R2 addressed at source scope. Client waiting reserves twelve seconds; service RuntimeMax is fifteen seconds below phase ceiling, explicit stop grace is five seconds, and GNU timeout reserves twenty seconds with five-second kill grace. Bounded queries check captured InvocationID. Terminal state and empty or released cgroup are required; reaping the client alone proves nothing about service termination.

Preservation checked. All frozen hashes and exact Git objects match. Four Lean texts, thirty names, runtime and dependency metadata are unchanged; native replay differs only in workspace identity. Full pre/post checks remain 16,736 files and 3,111,892,318 bytes each. Six producer mock controls were source-inspected, not independently executed or treated as live qualification.

Runtime dependencies. Filesystem reads, fsync and cgroup traversal are not hard realtime primitives; uninterruptible I/O may remain unresolved. Stop without overlap when ownership cannot be confirmed. Invocation checking followed by stop assumes exclusive ownership of the unique unit name. Actual complete receipts remain necessary.

Limits retained. Prior failure retains its 300-second debit: 46,500 of 46,800 campaign seconds remain before this 2,400-second attempt. One CPU, 8 GiB, no retries, deadline 6 November 2026 04:00 UTC. Dollar-facts waiver changes no other limit. Parent publication and admission precede execution.
